

Certainly, here's a simple example:

---

Distinguished members of the panel,

I appreciate the opportunity to present my perspective today. However, I must respectfully express my objection to the proposed conclusion drawn in the recent study under discussion. My objection is based on two primary factors: methodology and sample representativeness.

Firstly, the methodology employed appears to lack sufficient rigor in controlling for confounding variables, which could lead to skewed results. Without addressing these variables, the conclusions may not be as reliable as they should be.

Secondly, the sample size utilized in the study does not seem to adequately represent the population in question. A more diverse and larger sample could provide a more comprehensive understanding and lead to more universally applicable conclusions.

I urge the panel to reconsider these aspects before accepting the findings as definitive. Your attention to this matter is greatly appreciated.

Thank you for listening.
