

Good morning, everyone!

Today, we are going to learn about animal habitats. Habitats are the homes where animals live, just like we live in houses or apartments! Let's start with the forest. In the forest, you can find animals like deer, squirrels, and owls. Trees provide shelter and food for these animals. Squirrels collect nuts from the trees, and owls live in tree branches.

Next is the ocean. The ocean is home to fish, dolphins, and sea turtles. Fish swim in the water and find their food there. Dolphins love to jump and play! Sea turtles swim long distances and lay their eggs on sandy beaches.

Now, let's visit the desert. Deserts are hot and dry, but some animals like camels, lizards, and scorpions can live there. Camels have humps to store water, lizards bask in the sun to stay warm, and scorpions hide under rocks to stay cool.

Finally, let's take a look at the grasslands. Grasslands are wide open spaces with lots of grasses and few trees. This is where you'll find animals like lions, zebras, and elephants. Zebras eat grass, lions hunt for food, and elephants use their trunks to find water.

So, as you can see, different animals live in different habitats. Each habitat provides what the animals need to survive, like food, water, and shelter. Isn't it amazing how each animal has a perfect home?

Thank you for listening, and I hope you enjoyed learning about animal habitats!
