

Good afternoon everyone,

Today, I will guide you through the academic publishing process, a journey that transforms your research from a concept into a published work.

First, you start with your research, ensuring it contributes something new to your field. Once your study is complete, you write a manuscript detailing your methodology, findings, and significance.

Next, you select an appropriate journal that aligns with the topic of your research. Each journal has specific guidelines, so make sure your manuscript follows their requirements.

After submission, your manuscript undergoes a peer review process, where experts in the field evaluate its quality and validity. This stage might require you to make revisions based on their feedback.

Once revisions are made and the article is accepted, it moves into the production phase, where it's formatted for publication. Finally, your work is published and becomes accessible to the academic community, contributing to the ongoing dialogue within your field.

Thank you for your attention.
