

[Opening]

Ladies and gentlemen, esteemed faculty, proud parents, bewildered siblings, and most importantly, Class of 2023 graduates -- congratulations! You did it! You've survived the endless nights fueled by caffeine and instant noodles, the complex equations that seemed to defy the laws of nature, and the group projects where herding cats seemed more manageable.

[Body]

As engineering graduates, you're now proficient in turning coffee into algorithms, lunches into potential energy, and group chats into innovative solutions. You've mastered the art of deciphering professor hieroglyphics on a whiteboard, and you now wear "sleep deprivation" as a badge of honor.

You've spent years learning that "e" isn't always a vowel, that "C" isn't just a letter but a whole programming language, and that the "Law of Conservation of Energy" unfortunately does not apply to snacks during late-night study sessions.

But now, equipped with your hard-earned degrees, you are ready to face the real world, where the Wi-Fi signals are weak, the snacks don't appear magically, and the term "unlimited data" is as elusive as a perfect wireless connection on campus.

[Conclusion]

In closing, I wish you all the best as you step into the real world with your engineering degree. Own your journey, apply your skills creatively, and remember, if you can't find a solution to a problem, you can always try turning it off and on again.

Congratulations, Class of 2023! Go out there and engineer the future you want to live in. Thank you!
